Objectives of Seminar

Medical devices developed for human application are used for diagnostic or treatment purposes. They may either be an instrument, an apparatus or a material. Moreover, these devices can be used for daily patient care as well as for medical scientific purposes. Researchers in charge to develop new medical devices are faced with the complex task of making a medical device safe for human use. This implies that the device should be safe and effective. Risk management involves the identification, understand, control, and prevent failures that can result in hazards when people use medical devices. Risk Analysis plays a key role in the development of medical devices design. Risk analysis, or hazard analysis, is a structured tool for the evaluation of potential problems which could be encountered in connection with the use of taking a drug, or using a medical device. Manufacturers are expected to identify possible hazards associated with the design in both normal and fault conditions. If any risk is judged unacceptable, it should be reduced to acceptable levels by appropriate means. Hence, this seminar is to provide knowledge on safety surveillance of medical devices.
